

Automated Safeguards - Exclude an AWS Object from Automated Remediation

ClearDATA supports exclusion of automated remediation at the individual resource level. A typical use case is a S3 bucket that contains static images for a website, but the bucket resides in an account that processes PHI. A ticket can be opened with ClearDATA Support with the name of the bucket and the intended use case, and ClearDATA can add an exclusion to the bucket or other resource for the resource to be created.

Below is an example of a tagged resource, with the appropriate tag applied to the S3 bucket.
