

Automated Safeguards - Exclude an AWS Account From Automated Remediation

ClearDATA supports exclusion of automated remediation at the AWS account level. A typical use case for exclusion is an account for testing or development where no regulated data will reside. Please contact ClearDATA Support to request an exclusion at the AWS account level. Once the exclusion has been configured, non-compliant resources can be deployed. Please note that Iert notifications will still be issued, but no remediation will take place.

Accounts that have automated remediation disabled are not suitable to host any PHI or other sensitive Healthcare/Life Sciences Information.

Please contact ClearDATA Support to have one or more of your AWS accounts excluded from automated remediation.
